Prototype Revisions & Implementation Record

Family Information Centre | Source baseline: HIC_Family_Centre(20261102-005333).zip

SOURCE FINDINGS	IMPLEMENTATION	VERIFICATION
Task 5 (P1-P5)	Five targeted usability revisions	Backend tests, frontend tests, JSX/CSS parsing

1. Revision-to-finding trace

FINDING	USABILITY CONCERN	CODE REVISION
P1 | High | Major (3)	Editing existing records	Added household-scoped PATCH routes and prefilled Edit forms for announcements, contacts, and bills. Bill payment status remains unchanged when details are edited.
P2 | High | Major (3)	Selected calendar date	The main Family Calendar Add reminder action now passes the highlighted date to the reminder form.
P4 | Medium | Minor (2)	Overdue counts explained	The Overdue summary explicitly says it is included in To do / In progress, avoiding double-counting interpretation.
P3 | Medium | Minor (2)	Redundant list scrolling	Paginated chores, contact and announcement lists use page scrolling; the bills table still allows horizontal scrolling on narrow screens.
P5 | Low | Minor (2)	Creator role visibility	The sidebar reads Household creator for the account owner and Household member for others.

Scope: React/Vite frontend and FastAPI backend. Existing Supabase tables are reused; no schema migration is required. Other features, including Family Chat, were not modified.

Testing & Handoff Notes

2. Checks completed on the modified source

• 41 backend automated tests passed, including new tests for editing permissions, field validation and preserving paid-bill status.

• 7 frontend automated tests passed (4 existing checks plus 3 Task 7 regression checks).

• Modified JSX files passed TypeScript JSX syntax parsing; modified CSS files passed PostCSS parsing.

• No edits were made to authentication, Family Chat components, existing records, or the Supabase database.

3. Manual checks after installation

1. P1: Edit an announcement and a contact, reload the page, and verify the changes persist. Edit an already-paid bill and verify its status remains Paid.

2. P2: Select a date other than today in Family Calendar, click the primary Add reminder button, and verify Date is prefilled correctly.

3. P4: Open Tasks & Chores and check that Overdue is clearly described as part of unfinished tasks.

4. P3: Check the chores list, announcements, contacts, and bills on desktop and phone. Verify page pagination and horizontal table overflow without nested vertical list scrolling.

5. P5: Sign in as creator and as a regular member and compare their sidebar role labels.

6. Security: A member from a different household must not be able to edit another household's bills, contacts, or announcements.

4. Implementation status

Implemented and source-tested: P1, P2, P3, P4, P5. **Not yet independently verified:** a full Vite production build, real-device rendering, live Supabase behavior, and before/after screenshots. Capture real screenshots from the updated deployed prototype before presenting this as a completed user-validation report.

5. Deployment / rollback

Back up the November 2 project, overlay the changed-files ZIP while retaining the directory structure, restart FastAPI and Vite, then deploy both Vercel projects. A previous version can be restored by copying back the original matching files. No SQL commands are needed.

This record documents implemented source changes; it does not invent usability participant observations or screenshots.
